

Simulation configuration in Graphic Spice

1 Open the simulation panel

To open the simulation panel one can:

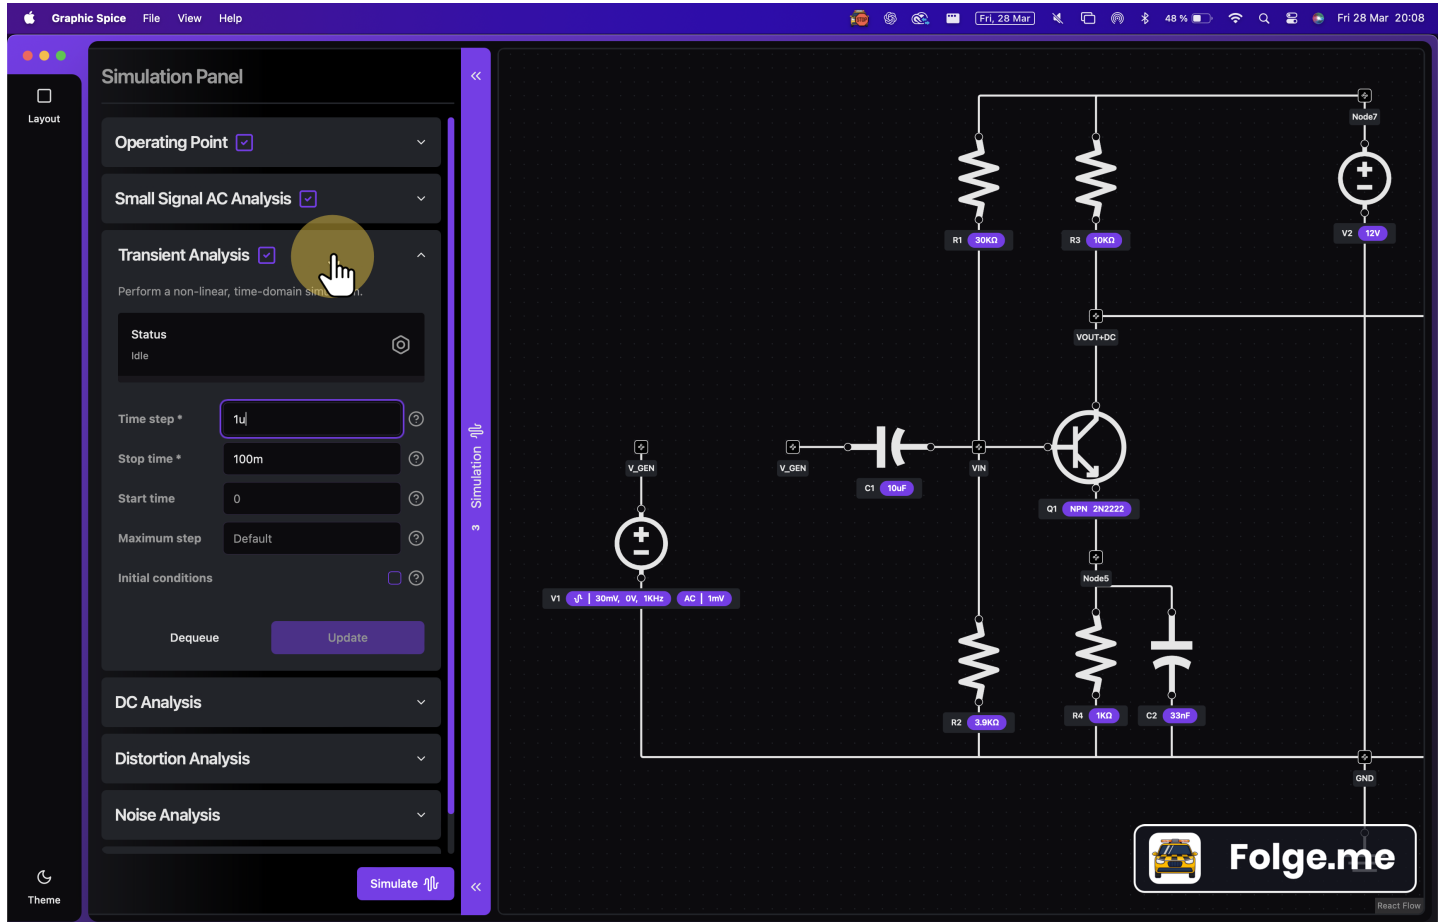

- Click the tab called "Simulation"
- Alternatively, one can press the following key combination: Command / Alt + S.

It can be observed that the simulation tab has a (3) on it. This means it has 3 preconfigured simulations.

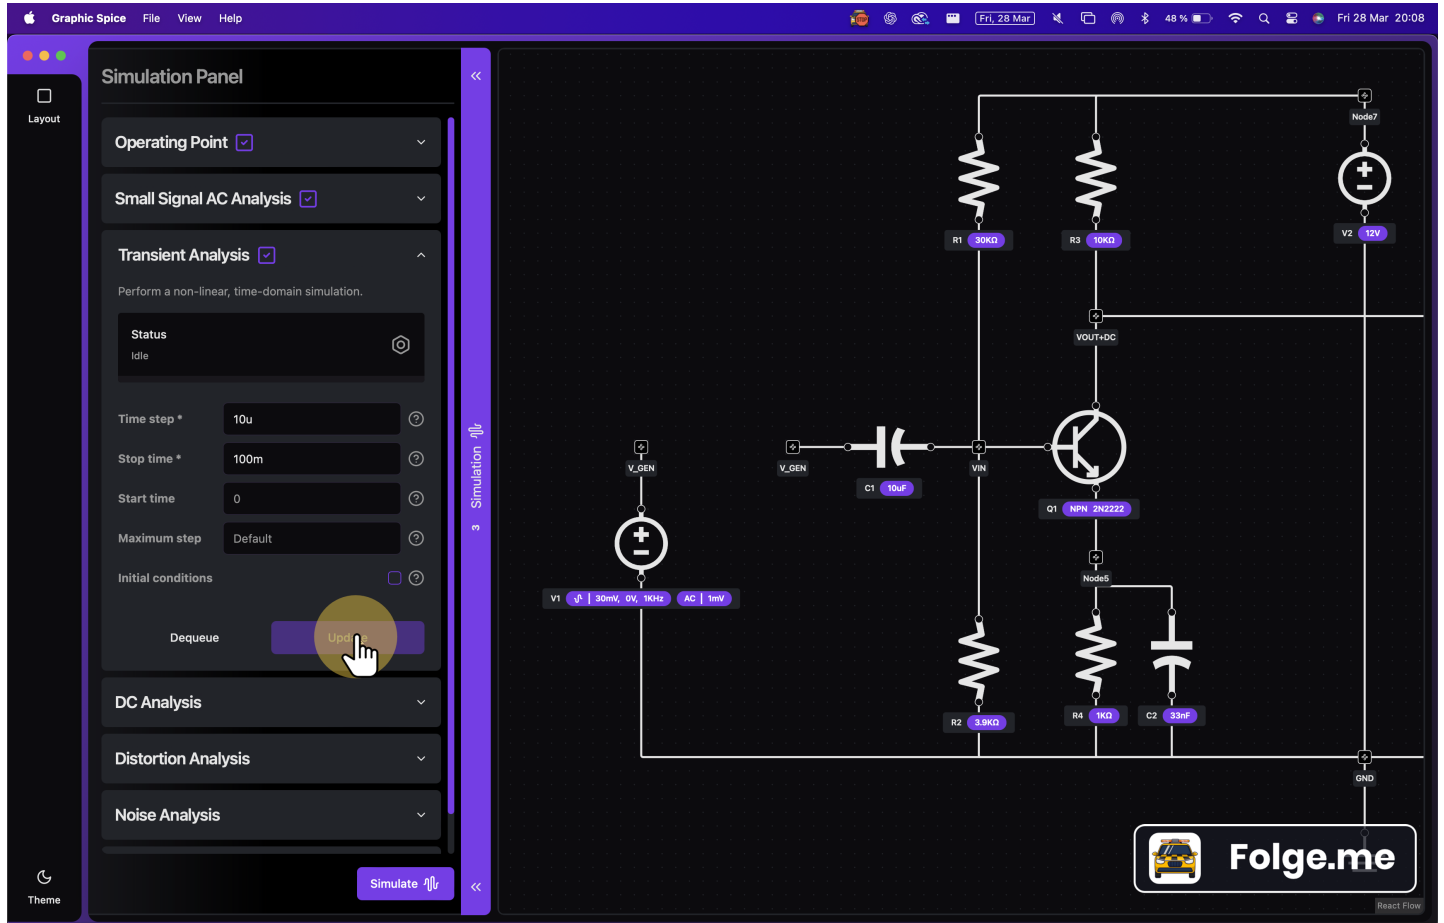

2 Open one simulation

By clicking any of the available simulation tabs, a config form will be revealed. Here, one can modify all its parameters to their own liking.

3 Updating a simulations configuration

In the case that any parameters be modified, one needs to save the performed changes.

4 Initialize simulation

Once satisfied with both the schematic and simulation configuration, one can initialize the simulation process:

- A small toast notification will be shown to indicate broad simulation status: started, stopped, failed.
- In the simulation panel, one can observe each individual running simulation status and progress.
